

Amendments to the Specification

Please replace the ABSTRACT with the following amended ABSTRACT:

"A communication system comprises ~~an obtaining means for~~ obtaining a corresponding dynamic address by sending an identifier to a mapping notification system which stores a pair of an identifier and a dynamic address; and a ~~determination means for~~ determining whether or not a dynamic address stored in the mapping notification system is correct by accessing other communication node to which the dynamic address obtained by the obtaining means is assigned. ~~The determination means determines whether or not the communication node is a communication node to be communicated, based on the~~ The system also compares ~~comparison of~~ the identifier sent to the mapping notification system and a reply for the access to the communication node. If ~~the determining means~~ the system determines that the address is not correct, (i) ~~said the~~ obtaining process and determination process are executed again, (ii) an execution of a process to be executed after ~~said the~~ determination process is stopped, or (iii) a control process for preventing from sending back a reply of ~~said the~~ address from the mapping notification system is executed."
